Weather Hazards Monitoring with GOES-R Data

SatPy is a versatile library for **reading**, **manipulating**, and **visualizing** data from weather satellites. In this section, we will explore more advanced capabilities of SatPy for processing weather satellite data, enabling us to work effectively with meteorological datasets.

Loading and Visualizing Satellite Data

In [23]:
```
# Import the warnings library, which allows control over warning messages.
import warnings

# Disable all warning messages to keep the output clean.
# This is useful in a lecture setting to avoid distracting students with non-critic
# that might arise from library functions used in processing geostationary satellit
warnings.filterwarnings('ignore')
```

In [24]:
```
# Import necessary components from the satpy library, which is crucial for satellit
from satpy.scene import Scene  # Scene is a central object in Satpy used to represe

# The 'find_files_and_readers' function automates the discovery of satellite data f
# This simplifies loading and processing satellite imagery, which is essential for
from satpy import find_files_and_readers
```

Searching for GOES-R L1B Data

In [25]:
```
# Import the os module to interact with the operating system and the glob module to
import os
import glob

# Define the base directory for satellite data relative to the current script's loc
# This is crucial for handling data files in a way that remains functional across d
base_dir = os.path.join('input_data', 'ABI-L1b-RadF')

# Construct a pattern to find specific subdirectories under the base directory.
# This pattern targets directories starting with 's20210992350171', which could be
pattern = os.path.join(base_dir, 's20210992350171*')
directories = glob.glob(pattern)  # Use glob to search for directories that match t

# Select the first directory found that matches the pattern. This directory will be
# It's common in data processing workflows to automate the selection of data subset
directory = directories[0]

# Load the satellite data using Satpy's find_files_and_readers function, specifying
# 'abi_l1b' refers to the reader for Level 1b data from the ABI instrument, which i
fGRl1b = find_files_and_readers(base_dir=directory, reader='abi_l1b')
```

```
# Output the result to show what files and readers are being used. This helps in de
fGRl1b

Properties

Area name:

GOES-East

Description:

1km at nadir

Projection:

{'ellps': 'GRS80', 'h': '35786023', 'lon_0': '-75', 'no_defs': 'None', 'proj': 'geos', 'sweep': 'x', 'type': 'crs', 'units': 'm', 'x_0': '0', 'y_0': '0'}

Width/Height:

10848/10848 Pixel

Resolution x/y (SSP):

1002.0/1002.0 m

Extent (ll_x, ll_y, ur_x, ur_y):

(-5434894.8851, -5434894.8851, 5434894.8851, 5434894.8851)
